

CYBER SECURITY TASK 01

PART F – SECURITY REFLECTION

NAME : BHAKTI MAHADEV PARHAD

1. What cybersecurity risks did you identify in your own digital habits?

After reviewing my digital security practices, I found that I already use strong and unique passwords, enable Multi-Factor Authentication (MFA), and keep recovery email addresses configured for my important accounts. However, I realized that I should be more careful when opening emails, clicking unknown links, and downloading files from the internet. I also recognized the importance of regularly reviewing my account security settings and creating backups of important data to reduce the impact of potential cyberattacks.

2. What security improvements will you implement immediately?

To further improve my digital security, I will regularly update my operating system and applications, review my account security settings, and back up important files on a regular basis. I will continue using strong and unique passwords for every account, keep MFA enabled wherever possible, and stay alert to phishing emails and suspicious websites. These improvements will help reduce the risk of unauthorized access and data loss.

3. Why is cybersecurity important in today's world?

Cybersecurity is important because people rely on digital technologies for communication, education, banking, shopping, and work. Personal and financial information is stored online, making it a target for cybercriminals. Good cybersecurity practices help protect sensitive data, prevent identity theft, reduce financial losses, and ensure privacy. As technology continues to evolve, understanding and following cybersecurity best practices is essential for creating a safer and more secure digital environment.
